

FUTURE CARIBBEAN 2026 • FINANCE, PAYMENTS & MSME CAPITAL

Sage in six receipts.

An AI agent that pays people for verified work
— and turns every payment into a credit
record a lender can read.

sagepays.xyz • built solo • live with real money since July

80–90% of Caribbean businesses are small. Lending is collateral-based.

Moving money between islands costs 7–9% on more than \$20bn a year. The work happens; nothing trustworthy records that it did.

Say the work once, in your own currency. Sage verifies and pays.

- A buyer describes the work in J\$, TT\$ or EC\$ and funds it once.
- The agent checks each deliverable itself and pays within minutes, inside spending limits enforced by code it cannot change.
- Every payment leaves a public receipt.

• PAYMENT INFRASTRUCTURE FOR VERIFIED WORK

An AI agent that moves money on verified work.

Fund it once and name your product. Sage decides what work to buy, designs it, verifies every deliverable, pays from a vault it cannot exceed — and turns every payout into a credit record a lender can underwrite.

graph

26 of 65 decisions were refusals — each with the reason on record.

Sanctions screening on every payment path. One person, one slot on public work. A cash-flow record is only worth underwriting when the money behind it was verified before it moved.

Every payment lands on a record a lender can read in one call.

- Inflow over 30 and 90 days, distinct payers, tenure, verification pass rate — published formulas, never a score.
- A working-capital door: an advance sized from verified inflow, repaid from the next payments.

The system is built. It needs the institutions it was built for.

MSME programmes, cooperatives, contractor payrolls, lending desks that want to price cash flow instead of collateral.
